

Biogas For Greener Farms Switzerland

Small-scale biogas plants contribute to efficient farms and a better environment

Small-scale agricultural biogas plants in Switzerland prevent the release of greenhouse gases, support innovative farmers, and foster sustainable local value chains. This project protects against climate change and helps to build a more secure energy supply system in Switzerland.

The Context

Swiss farms produce large amounts of manure, harvest residues and other organic waste. If these materials are stored in open containers, greenhouse gases such as methane, carbon dioxide and nitrous oxide are released freely into the atmosphere.

The Project

By installing a biogas digester, farmers can use methane to generate renewable electricity. In total, 11 biogas plants participate in this programme, which reduces fossil fuels and mitigates greenhouse gas emissions. Swiss ISO Biogas promotes innovative farmers and contributes to a decentralised energy supply system in Switzerland. Generated carbon credits are verified by internationally renowned and accredited companies and the CSA registries.

The Benefits

The benefits of recycling methane in agricultural farming is twofold: it enables both the production of green energy and the prevention of harmful greenhouse gas emissions from composting. Not only is the polluting effect of manure reduced, but so is the odour from fertilising with untreated manure. Farmers also save money as the by-product of the digester is a rich natural fertiliser, so they don't need to buy artificial fertilisers. In general, this biogas farming system switches farms to a lower intensity of soil-use, positively impacting field fertility and local wildlife.

Farmers can reduce their energy costs and contribute to a sustainable energy supply system in Switzerland.

11
biogas plants

generate green electricity to power Swiss homes

8,600
tCO₂e

mitigated on average annually, by providing an energy alternative to the burning of fossil fuels

Additionality and Permanence

According to the ISO 14064, Swiss-VER (Verified Emission Reduction) guidelines

Validated by
